

**Question 11.16.4.9**

If 4-digit numbers greater than 5,000 are randomly formed from the digits 0, 1, 3, 5, and 7, what is the probability of forming a number divisible by 5 when:

1. The digits are repeated?
2. The repetition of digits is not allowed?

**solution:** Let  $X$  be a random variable such that:

$$X = \begin{cases} 0 & n \not\equiv 0 \pmod{5} \\ 1 & n \equiv 0 \pmod{5} \end{cases} \quad (1)$$

Let  $X_1, X_2, X_3, X_4$  be the first, second, third and fourth digits of  $X$  respectively.

Let's solve each part separately.

**(i) Repetition of digits**

Let number of favourable outcomes be  $N(A)$  and total outcomes be  $N(T)$ .

For  $X > 5000$ ,

1.  $X_1$  must be 5 or 7.
2.  $X_2, X_3, X_4$  can be 0, 1, 3, 5, 7.

We must also exclude the case of 5000. Hence,

$$N(T) = (2 * 5 * 5 * 5) - 1 \quad (2)$$

$$\implies N(T) = 249 \quad (3)$$

For  $n$  to be greater than 5000 and also divisible by 5:

1.  $X_1$  must be 5 or 7.
2.  $X_2, X_3$  can be 0, 1, 3, 5, 7.
3.  $X_4$  must be 0 or 5.

Here also we must exclude the case of 5000.

$$N(A) = (2 * 5 * 5 * 2) - 1 \quad (4)$$

$$\implies N(A) = 99 \quad (5)$$

With this information we can find the required answer,

$$\Pr(X = 1) = \frac{N(A)}{N(T)} \quad (6)$$

$$\implies \Pr(X = 1) = \frac{33}{83} \quad (7)$$

**(ii) No Repetition of Digits**

Let number of favourable outcomes be  $N(B)$  and total outcomes be  $N(T)$ .

For  $X > 5000$ ,

1.  $X_1$  must be 5 or 7.

2.  $X_2, X_3, X_4$  have no constraints.

Hence,

$$N(T) = (2 * 4 * 3 * 2) \quad (8)$$

$$\implies N(T) = 48 \quad (9)$$

For  $n > 5000$  and also divisble by 5:

$$X_4 = \begin{cases} 0 & X_1 = 5 \\ 5, 0 & X_1 = 7 \end{cases} \quad (10)$$

Hence,

$$N() = (1 * 3 * 2 * 1) + (1 * 3 * 2 * 2) \quad (11)$$

$$\implies N(A) = 18 \quad (12)$$

With this information we can find the required answer,

$$\Pr(X = 1) = \frac{N(B)}{N(T)} \quad (13)$$

$$\implies \Pr(X = 1) = \frac{3}{8} \quad (14)$$
